BACKYARD OASIS

FROM EYESORE TO ASSET

Ponds provide both beauty and function to any landscape, creating an oasis to enjoy while relaxing and having fun with family and friends.

Used for everything from water gardening and fishing to retention ponds and stormwater basins; although versatile these water bodies can create some unique challenges when it comes to managing them. Due to their smaller size and shallow depth they are in great need of oxygen and circulation to keep them healthy. Let Otterbine help improve and maintain water quality in your pond to get the most out of your water feature.

OXYGEN IS THE KEY TO LIFE

Aeration mixes cool bottom water with warm surface water, and induces oxygen throughout the water column. This increased oxygen encourages production of healthy bacteria that will consume excess nutrients, returning your water feature to a sparkling asset to be enjoyed by all.

KNOW YOUR POND & SITE REQUIREMENTS

THE BASICS OF WHAT YOU NEED
TO KNOW WHEN SELECTING AN
AERATING FOUNTAIN SYSTEM

SURFACE AREA

Surface area will determine the size system you need when water quality is desired. Rule of thumb is 1.5HP per surface acre.

DEPTH

Otterbine's 1/2HP Aerating Fountain System requires 16 inches (41cm) of depth; while our 1-5HP systems require 30in (75cm)

INCOMING WATER

Excess nutrient loading from stormwater run-off, fertilizers and even grass clippings can play a dramatic role in the health of your water feature.

AVAILABLE POWER

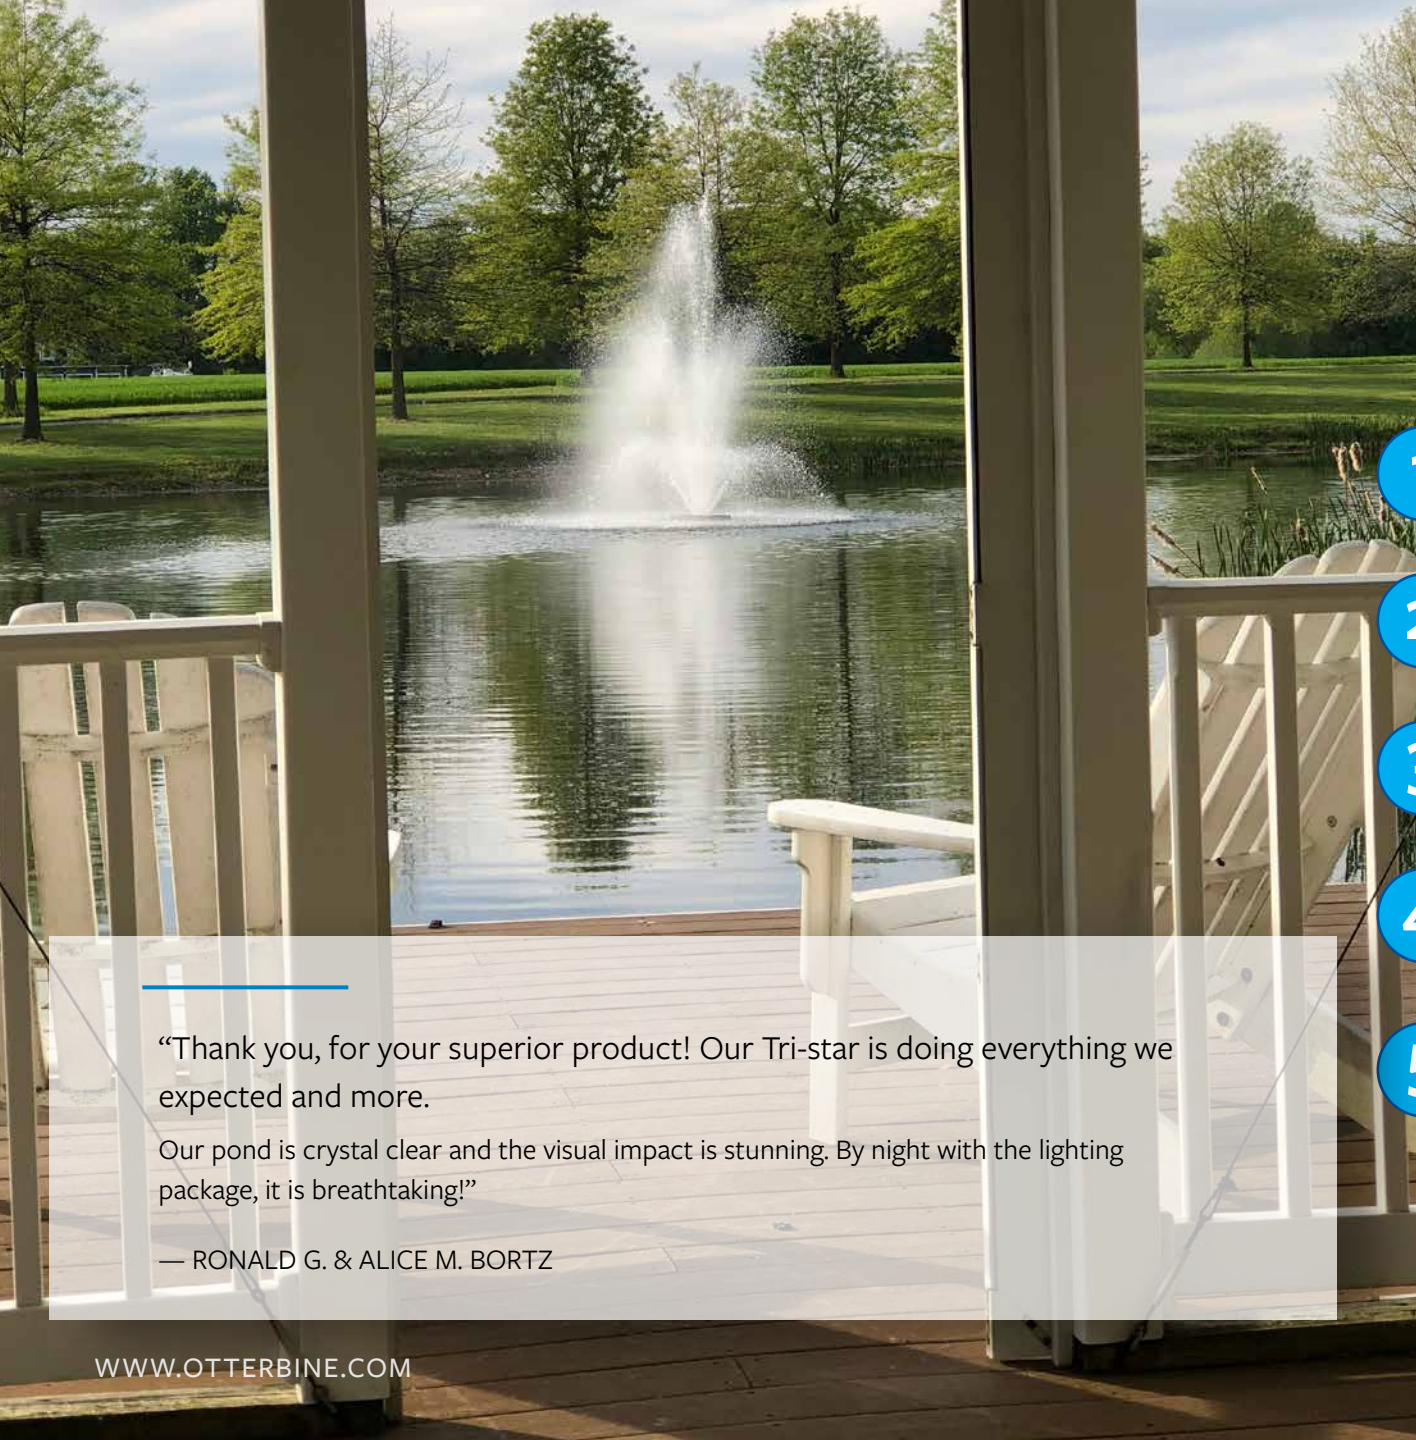

Installation is a breeze with our 115V fountains; while our 230V units are more energy efficient and allow for longer cable runs.*

DON'T KNOW THE SIZE OF
YOUR POND, WE CAN HELP!
